

Abstract of the Disclosure

POLISHING SLURRY

- Polishing slurry has abrading particles dispersed in a liquid dispersant. The
- 5 abrading particles are composite particles each having a first particle and a plurality of second particles smaller than the first particles attached to the surface of the first particle through a metal oxide membrane. The first particles have average diameter of 0.1-20 $\mu$ m and the second particles have average diameter of 0.001-0.5 $\mu$ m. Elastic particles may be used as the first particles such as polymer particles.
